Minimal Tropical Motive Rank Bounds Resolution Proof Width

Entry ID: `fac73cba41ff` **Verdict**: `INCONCLUSIVE` **Recorded**: 2026-05-30 04:27:18 UTC

1. Conjecture

Field A (mathematical branch): Tropical Geometry **Field B** (complexity object): Boolean Function Complexity: Resolution Proof Complexity

Statement:

> For every k-CNF φ with n variables, the minimal tropical motive rank (tmr(φ)) of its tropical motives is upper bounded by a function g(n) such that n^(Ω(g(n))) ≤ t*(φ), where t*(φ) denotes the width of the smallest tree-like resolution proof for φ.

Rationale (proposer's reasoning):

> Tropical geometry provides a rich framework to study algebraic structures in a combinatorial setting. Motive theory, a branch of algebraic geometry, has not been extensively applied to complexity theory. A connection between tropical motive rank and resolution proof width could reveal new insights into the structure of Boolean functions and their computational complexity.

Taxonomy category: `c003b_cumulative_entropy` (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): `9fd683007e1d09c5`

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

> For a given k-CNF φ with n variables, if the ratio between tmr(φ) and t*(φ) is less than or equal to n^0.5 for all seeds in the sample set of 30 random seeds, then the conjecture is supported. If any seed produces a ratio greater than n^0.5, the conjecture is falsified.

3. Barrier filter (F1)

Final: `PASS`

Barrier	Verdict	Confidence	LLM₁	LLM₂
RELATIVIZATION	UNCERTAIN	1.00	HITS	UNCERTAIN
NATURAL_PROOFS	SAFE	0.50	UNCERTAIN	UNCERTAIN
ALGEBRIZATION	SAFE	0.50	UNCERTAIN	UNCERTAIN
KARP_LIPTON	SAFE	0.50	UNCERTAIN	UNCERTAIN

4. Novelty audit

Verdict: `NOVEL` against 0 hits across arXiv + Semantic Scholar + ECCC

Search queries (3): - `"tropical geometry" AND "Boolean function complexity" AND "resolution proof complexity"` - `"minimal tropical motive rank" AND "Resolution proof width"` - `"CNF" AND "tropical motive" AND "proof complexity"`

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)
Sandbox: isolated subprocess, stdlib-only, ≤90s wall time per cycle **Execution**: rc=0, elapsed=0.5s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy — FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
    Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
    proofStateEntropy(sigma) := sigma.activeClauses.card
    cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` — the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

8. Critic adversarial review

Critic verdict: `CHALLENGE`

Critic reasoning:

> The test code provided does not implement the conjecture’s primitives, such as tropical motive rank (tmr) or tree-like resolution proof width (t*(φ)). It instead computes a metric named ‘phi_count_loglog_slope_vs_n’, which is unrelated to the conjecture. The test uses Tseitin formulas and Davis-Putnam variable elimination, but these are not directly related to the mathematical definitions of tropical motive rank or resolution proof width as stated in the conjecture.

9. Final verdict & safety rail

Verdict: `INCONCLUSIVE`

Reasoning:

> The test code does not implement the conjecture’s primitives for tropical motive rank (tmr) or tree-like resolution proof width (t*(φ)). Instead, it computes a metric unrelated to the conjecture. The critic has challenged the validity of the test. | next: Implement the conjecture’s primitives and conduct a test that directly measures tmr(φ) and t*(φ) for k-CNF φ with n variables.*

(full prompt+response transcripts available in `research/audit/fac73cba41ff.jsonl`)

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/fac73cba41ff.jsonl` for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: `research/pvsnp_sandbox/test_*.py` (per-cycle)
Replay tarball: `research/replay/fac73cba41ff.tar.gz` (if generated)
