Minimal Generators of Geometric Group Actions Bounds Resolution Proof Width

Entry ID: 2b5e8a6a758f **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-29 11:51:17 UTC

1. Conjecture

Field A (mathematical branch): Geometric Group Theory (Geometric Group Actions) **Field B** (complexity object): Complexity Theory: Resolution Proof Complexity

Statement:

For a given Tseitin formula φ , the minimal number of generators required to express its corresponding geometric group action on an associated hyperbolic space is bounded by the width of its tree-like resolution proof. Specifically, let $|G|$ be the geometric group action generated by φ , and let $w(\varphi)$ be the width of the tree-like resolution proof for φ . Then, $|G| \leq c * w(\varphi)$ for some constant c .

Rationale (proposer's reasoning):

Geometric group actions have been used to study complexity through their connection with quasigeodesics, which can provide bounds on communication complexity. By examining the minimal generators of such actions, we may uncover a new structural link that could bound resolution proof width, offering insights into the complexity of Tseitin formulas.

Taxonomy category: c003b_cumulative_entropy (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): d5bdf820f460369e

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

For a Tseitin formula φ , if the geometric group action $|G|$ is bounded by a constant multiple of the resolution proof width $w(\varphi)$, specifically $|G| \leq c * w(\varphi)$ for some constant c , then the conjecture is supported.

3. Barrier filter (F1)

Final: PASS

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
RELATIVIZATION	SAFE	1.00	SAFE	SAFE
NATURAL_PROOFS	SAFE	0.50	UNCERTAIN	UNCERTAIN
ALGEBRIZATION	SAFE	0.95	SAFE	SAFE
KARP_LIPTON	SAFE	0.50	UNCERTAIN	UNCERTAIN

4. Novelty audit

Verdict: NOVEL against 0 hits across arXiv + Semantic Scholar + ECCC

Search queries (3): - geometric group theory AND resolution proof complexity - tree-like resolution proof IN geometric group actions - Tseitin formula AND minimal generators geometric group action

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)

Sandbox: isolated subprocess, stdlib-only, ≤90s wall time per cycle **Execution:** rc=0, elapsed=0.4s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
  Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
  proofStateEntropy(sigma) := sigma.activeClauses.card
  cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

8. Critic adversarial review

Critic verdict: CHALLENGE

Critic reasoning:

The test code focuses on computing the cumulative proof entropy for Tseitin formulas using Davis-Putnam variable elimination. However, it does not address the conjecture's core requirement of bounding the minimal number of generators required to express the geometric group action. The metric used (`phi_count_loglog_slope_vs_n`) is related to the number of clauses but does not directly measure the width of the tree-like resolution proof or the geometric group action.

9. Final verdict & safety rail

Verdict: INCONCLUSIVE

Reasoning:

The test code focuses on computing the cumulative proof entropy for Tseitin formulas using Davis-Putnam variable elimination, which does not directly measure the width of the tree-like resolution proof or the geometric group action as required by the conjecture. The critic has challenged the results, and the pre-registered support condition is not unambiguously met. | next: Develop a new test that directly measures the minimal number of generators for the geometric group action and the width of

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/2b5e8a6a758f.jsonl` for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: `research/pvsnp_sandbox/test_*.py` (per-cycle)

Replay tarball: `research/replay/2b5e8a6a758f.tar.gz` (if generated)
