Hodge Diamond Invariant and Resolution Proof Width in Tseitin Formulas

Entry ID: c2d46cc9f3ad **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-29 13:45:05 UTC

1. Conjecture

Field A (mathematical branch): Algebraic Geometry (Hodge Theory) **Field B** (complexity object): Complexity Theory: Resolution proof complexity

Statement:

For every Tseitin formula with n variables and m clauses, the Hodge diamond invariant of its associated Kähler form is upper bounded by the square root of the resolution proof width.

Rationale (proposer's reasoning):

The Hodge diamond invariant has been used to study algebraic structures in geometry. Applying this to the resolution proof complexity of Tseitin formulas could reveal a new geometric perspective on computational hardness. The conjecture suggests that complex Tseitin formulas (with high resolution proof width) have associated Kähler forms with large Hodge diamond invariants, providing a potential new approach to proving lower bounds for resolution proof width.

Taxonomy category: c003b_cumulative_entropy (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): 7a090a332153e05e

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

For a Tseitin formula with n variables and m clauses, if the Hodge diamond invariant is less than or equal to the square root of its resolution proof width for all seeds, then the conjecture is supported. If any seed shows the Hodge diamond invariant exceeding the square root of the resolution proof width, the conjecture is falsified.

3. Barrier filter (F1)

Final: PASS

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
RELATIVIZATION	SAFE	0.50	UNCERTAIN	UNCERTAIN
NATURAL_PROOFS	SAFE	0.50	UNCERTAIN	UNCERTAIN
ALGEBRIZATION	UNCERTAIN	0.90	UNCERTAIN	HITS
KARP_LIPTON	SAFE	0.50	UNCERTAIN	UNCERTAIN

4. Novelty audit

Verdict: NOVEL against 0 hits across arXiv + Semantic Scholar + ECCC

Search queries (3): - "Hodge Diamond Invariant" AND "resolution proof complexity" - "Tseitin formula" AND "Kähler form" AND "proof complexity" - "Algebraic Geometry" AND Tseitin AND resolution

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)

Sandbox: isolated subprocess, stdlib-only, ≤90s wall time per cycle **Execution:** rc=0, elapsed=0.4s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
  Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
  proofStateEntropy(sigma) := sigma.activeClauses.card
  cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

```

8. Critic adversarial review

Critic verdict: CHALLENGE

Critic reasoning:

The test only considers up to $n=14$ and the metric mean is 2.414, which may not be representative for larger values of n . The conjecture involves an upper bound on the Hodge diamond invariant by the square root of the resolution proof width, which could fail for larger n if the metric does not scale trivially with n .

9. Final verdict & safety rail

Verdict: INCONCLUSIVE

Reasoning:

Safety rail: critic_challenge | original judge: The test results show that the conjecture holds for all tested instances up to $n=14$. | next: Further investigation is needed to confirm the conjecture's validity for larger values of n , as suggested by the critic.

11. Audit log (LLM calls)

Total LLM calls: 6

#	Phase	Provider	Model	Tokens in	out	Latency (ms)

(full prompt+response transcripts available in `research/audit/c2d46cc9f3ad.jsonl`)

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/c2d46cc9f3ad.jsonl` for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: `research/pvsnp_sandbox/test_*.py` (per-cycle)

Replay tarball: `research/replay/c2d46cc9f3ad.tar.gz` (if generated)
