## Kähler Manifold Volume and Resolution Proof Entropy Ratio

**Entry ID:** e991f698f165 **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-29 13:37:50 UTC

### 1. Conjecture

**Field A** (mathematical branch): Complex Geometry (Kähler Manifolds) **Field B** (complexity object): Resolution proof complexity

#### Statement:

For every Tseitin formula  $\varphi$  with  $n$  variables, the ratio of its Kähler manifold volume to its resolution proof entropy satisfies  $|\text{vol}(K_\varphi)/\Phi(\varphi)| \leq c^n$  for a constant  $c > 0$ .

#### Rationale (proposer's reasoning):

Kähler manifolds encode geometric information that could potentially reflect the complexity of resolving Tseitin formulas. If the volume grows polynomially with respect to the entropy, it suggests a deep connection between geometric structure and proof complexity.

**Taxonomy category:** c003b\_cumulative\_entropy (status at proposal time: )

### 2. Pre-registration (Popper-style)

**Hash (SHA-256 prefix):** 230bd6d5b4701858

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

#### Acceptance criterion:

The conjecture is supported if, for all Tseitin formulas  $\varphi$  with  $n$  variables, the ratio of its Kähler manifold volume to its resolution proof entropy  $|\text{vol}(K_\varphi)/\Phi(\varphi)|$  is bounded by a polynomial function of  $n$ , specifically  $|\text{vol}(K_\varphi)/\Phi(\varphi)| \leq c^n$  for a constant  $c > 0$ .

### 3. Barrier filter (F1)

**Final:** PASS

| Barrier        | Verdict   | Confidence | LLM <sub>1</sub> | LLM <sub>2</sub> |
|----------------|-----------|------------|------------------|------------------|
| RELATIVIZATION | UNCERTAIN | 1.00       | UNCERTAIN        | HITS             |
| NATURAL_PROOFS | SAFE      | 0.50       | UNCERTAIN        | UNCERTAIN        |
| ALGEBRIZATION  | SAFE      | 0.50       | UNCERTAIN        | UNCERTAIN        |

| Barrier     | Verdict | Confidence | LLM <sub>1</sub> | LLM <sub>2</sub> |
|-------------|---------|------------|------------------|------------------|
| KARP_LIPTON | SAFE    | 0.50       | UNCERTAIN        | UNCERTAIN        |

## 4. Novelty audit

**Verdict:** NOVEL against 0 hits across arXiv + Semantic Scholar + ECCC

**Search queries** (3): - "Kähler manifold volume" AND "resolution proof complexity" - "Tseitin formula" AND "volume to resolution entropy ratio" - "complex geometry" AND "resolution proof entropy"

## 5. Empirical test harness

**Multi-seed protocol:** 5 seeds (11, 23, 37, 53, 71)

**Sandbox:** isolated subprocess, stdlib-only, ≤90s wall time per cycle **Execution:** rc=0, elapsed=0.4s

### 5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
    Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
    proofStateEntropy(sigma) := sigma.activeClauses.card
    cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

```

## 8. Critic adversarial review

**Critic verdict:** CHALLENGE

**Critic reasoning:**

The test only includes n up to 14, which is too small to draw a definitive conclusion about the conjecture's validity for all Tseitin formulas. The metric mean and standard deviation may not accurately represent the behavior of larger n.

## 9. Final verdict & safety rail

**Verdict:** INCONCLUSIVE

**Reasoning:**

Safety rail: critic\_challenge | original judge: The test results indicate that for the tested instances up to n=14, the conjecture holds true. | next: Further testing with larger values of n is needed to confirm the conjecture's validity for all Tseitin formulas.

## 11. Audit log (LLM calls)

**Total LLM calls:** 6

| # | Phase           | Provider      | Model       | Tokens in | out | Latency (ms) |

(full prompt+response transcripts available in `research/audit/e991f698f165.jsonl`)

## 12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/e991f698f165.jsonl` for verification of provenance

4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

**Sandbox file:** `research/pvsnp_sandbox/test_*.py` (per-cycle)

**Replay tarball:** `research/replay/e991f698f165.tar.gz` (if generated)
