Minimal Symplectic Leaf Count Bounds Cumulative Proof Entropy

Entry ID: f1c5194b0770 **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-30 05:29:44 UTC

1. Conjecture

Field A (mathematical branch): Symplectic Geometry **Field B** (complexity object): Proof entropy

Statement:

For Tseitin formulas with d -regular graphs, the cumulative proof entropy $\Phi(\pi) = \sum_t |\text{activeClauses}(\sigma_t)|$ (where σ_t is the proof state at time t and activeClauses counts clauses that are not resolved yet) for a resolution refutation π is lower-bounded by $c \cdot \log_2(S) \cdot n^2$, where S is the size of the largest symplectic leaf in the associated variety and n is the number of variables.

Rationale (proposer's reasoning):

Symplectic geometry provides a rich structure to study the complexity of proof systems. The conjecture leverages the idea that larger symplectic leaves correspond to more complex proof states, leading to higher entropy. This could expose previously unknown relationships between symplectic geometry and proof complexity.

Taxonomy category: c003b_cumulative_entropy (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): ea5bc24905ffe74c

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

The cumulative proof entropy $\Phi(\pi)$ is lower-bounded by $c \cdot \log_2(S) \cdot n^2$ if, for all seeds, the mean of $\Phi(\pi)/[c \cdot \log_2(S) \cdot n^2]$ across simulations is greater than or equal to 0.8.

3. Barrier filter (F1)

Final: PASS

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
RELATIVIZATION	SAFE	1.00	SAFE	SAFE
NATURAL_PROOFS	SAFE	0.50	UNCERTAIN	UNCERTAIN
ALGEBRIZATION	SAFE	1.00	SAFE	SAFE
KARP_LIPTON	SAFE	1.00	SAFE	SAFE

4. Novelty audit

Verdict: ADJACENT_OK against 5 hits across arXiv + Semantic Scholar + ECCC

Search queries (3): - symplectic geometry AND proof entropy - cumulative proof entropy IN symplectic geometry - Tseitin formulas AND d-regular graphs AND $c \cdot \log_2(S) \cdot n^2$

Top relevant hits considered: - [http://arxiv.org/abs/1811.09984v4] Translated points for contactomorphisms of prequantization spaces over monotone symplectic toric manifolds - [http://arxiv.org/abs/math/0601540v1] Symplectic forms and surfaces of negative square - [http://arxiv.org/abs/1703.01731v2] On the existence of infinitely many non-contractible periodic orbits of Hamiltonian diffeomorphisms of closed symplectic - [http://arxiv.org/abs/1612.04764v1] Cohomological aspects on complex and symplectic manifolds - [http://arxiv.org/abs/1009.2975v3] 2-plectic geometry, Courant algebroids, and categorified prequantization

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)

Sandbox: isolated subprocess, stdlib-only, $\leq 90s$ wall time per cycle **Execution:** rc=0, elapsed=0.5s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
    Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
    proofStateEntropy(sigma) := sigma.activeClauses.card
    cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

8. Critic adversarial review

Critic verdict: CHALLENGE

Critic reasoning:

The test code does not provide any implementation of the ‘symplectic leaf count’ or its size ‘S’, which are crucial for evaluating the conjecture. The empirical test only measures cumulative proof entropy, which is a different metric than the one stated in the conjecture.

9. Final verdict & safety rail

Verdict: INCONCLUSIVE

Reasoning:

The test code does not provide any implementation of the ‘symplectic leaf count’ or its size ‘S’, which are crucial for evaluating the conjecture. The empirical test only measures cumulative proof entropy, which is a different metric than the one stated in the conjecture.
| next: Implement the calculation of symplectic leaf count and its size ‘S’ to directly test the conjecture.

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/flc5194b0770.jsonl` for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: `research/pvsnp_sandbox/test_*.py` (per-cycle)

Replay tarball: `research/replay/flc5194b0770.tar.gz` (if generated)
