Minimal Generators of Tropical Curves in Tseitin Formulas Bound Proof Entropy

Entry ID: ee4a024f8f50 **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-29 12:11:59 UTC

1. Conjecture

Field A (mathematical branch): Tropical Geometry **Field B** (complexity object): Complexity Theory: Proof Entropy

Statement:

For a given d -regular graph, the minimal number of generators for the tropical curve associated with any Tseitin formula over the graph is bounded by a function of the proof entropy $\Phi(\pi)$ of the resolution proof π for the formula.

Rationale (proposer's reasoning):

Tropical geometry provides an elegant way to encode combinatorial structures like Tseitin formulas, and its invariants can potentially reveal hidden complexity-theoretic properties. The minimal number of generators for a tropical curve corresponds to the number of parameters needed to define it, which might correlate with the complexity of finding a proof.

Taxonomy category: c003b_cumulative_entropy (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): bc15da60807eb608

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

The conjecture is supported if, for all d -regular graphs on n vertices, the mean minimal number of generators to define the tropical curve is less than or equal to a function $f(\Phi)$ of the proof entropy $\Phi(\pi)$, where the difference between $\Phi(\pi)$ and $f(\Phi)$ has a p -value ≤ 0.05 in a statistical test over at least 100 seeds.

3. Barrier filter (F1)

Final: PASS

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
RELATIVIZATION	SAFE	1.00	SAFE	SAFE
NATURAL_PROOFS	SAFE	1.00	UNCERTAIN	SAFE
ALGEBRIZATION	SAFE	1.00	SAFE	SAFE
KARP_LIPTON	SAFE	1.00	SAFE	SAFE

4. Novelty audit

Verdict: ADJACENT_OK against 8 hits across arXiv + Semantic Scholar + ECCC

Search queries (3): - tropical geometry AND complexity theory proof entropy - Tseitin formulas bound on minimal generators tropical curves AND proof entropy - minimal number of generators Tseitin formula d-regular graph AND tropical geometry proof entropy

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)

Sandbox: isolated subprocess, stdlib-only, ≤90s wall time per cycle **Execution:** rc=0, elapsed=0.4s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
    Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
    proofStateEntropy(sigma) := sigma.activeClauses.card
    cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

```

8. Critic adversarial review

Critic verdict: CHALLENGE

Critic reasoning:

The test code provided does not include the implementation of the ‘tropical curve associated with any Tseitin formula over the graph’ or its minimal generators. The conjecture statement refers to a specific mathematical object that is not defined or computed in the test code, which makes it impossible to assess whether the measured metric is indeed bounded by a function of the proof entropy.

9. Final verdict & safety rail

Verdict: INCONCLUSIVE

Reasoning:

The test code does not implement the ‘tropical curve associated with any Tseitin formula over the graph’ or its minimal generators, as challenged by the critic. This makes it impossible to assess whether the measured metric is bounded by a function of the proof entropy. | next: Implement the missing parts of the test code to compute the tropical curve and its minimal generators, then retest the conjecture.

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in research/audit/ee4a024f8f50.jsonl for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: research/pvsnp_sandbox/test_*.py (per-cycle)

Replay tarball: research/replay/ee4a024f8f50.tar.gz (if generated)
