Minimal Number of Simplicial Complexes Associated with Boolean Functions Bounds Resolution Proof Width

Entry ID: 8024596cca62 **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-29 14:18:31 UTC

1. Conjecture

Field A (mathematical branch): Topological Data Analysis (Simplicial Complexes) **Field B** (complexity object): Resolution proof complexity

Statement:

For a given Boolean function f , the minimal number of simplicial complexes needed to represent f in terms of its vanishing sets is $\Omega(\log^2(n))$ where n is the number of variables. This implies that for all instances with $n \leq 40$, the resolution proof width is at least $\Theta(\log^2(n))$.

Rationale (proposer's reasoning):

Topological data analysis provides a way to study the complexity of functions through simplicial complexes. By associating simplicial complexes with Boolean functions and analyzing their properties, we may uncover new insights into the structure of resolution proofs.

Taxonomy category: c003b_cumulative_entropy (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): 3d204b9ab7c7d0c6

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

For a Boolean function f with $n \leq 40$ variables, the resolution proof width is at least $\Theta(\log^2(n))$ if and only if the correlation coefficient between the number of vertices/edges in its associated simplicial complex and the resolution proof width is ≥ 0.5 for all instances.

3. Barrier filter (F1)

Final: PASS

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
RELATIVIZATION	UNCERTAIN	1.00	UNCERTAIN	HITS
NATURAL_PROOFS	SAFE	0.70	UNCERTAIN	UNCERTAIN
ALGEBRIZATION	UNCERTAIN	1.00	UNCERTAIN	HITS
KARP_LIPTON	SAFE	0.50	UNCERTAIN	UNCERTAIN

4. Novelty audit

Verdict: NOVEL against 0 hits across arXiv + Semantic Scholar + ECCC

Search queries (3): - "topological data analysis" AND "simplicial complexes" AND "resolution proof complexity" - "Boolean function" AND "minimal number of simplicial complexes" AND "vanishing sets" - "resolution proof width" AND " $\theta(\log^2(n))$ " AND "Topological Data Analysis"

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)

Sandbox: isolated subprocess, stdlib-only, ≤ 90 s wall time per cycle **Execution:** rc=0, elapsed=0.4s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
    Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
    proofStateEntropy(sigma) := sigma.activeClauses.card
    cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

8. Critic adversarial review

Critic verdict: CHALLENGE

Critic reasoning:

The test code focuses on the cumulative proof entropy (phi_count) in resolution refutations of Tseitin formulas, which does not directly measure the minimal number of simplicial complexes associated with Boolean functions. The conjecture is about the resolution proof width, which is a different concept.

9. Final verdict & safety rail

Verdict: INCONCLUSIVE

Reasoning:

The test focuses on cumulative proof entropy (phi_count) rather than directly measuring the minimal number of simplicial complexes associated with Boolean functions, which is the core of the conjecture. The critic's challenge and the pre-registered support condition not being unambiguously met downgrade the verdict from SUPPORTED to INCONCLUSIVE. | next: Further investigation is needed to clarify the relationship between phi_count and minimal number of simplicial complexes. Consider a different

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/8024596cca62.jsonl` for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: `research/pvsnp_sandbox/test_*.py` (per-cycle)

Replay tarball: `research/replay/8024596cca62.tar.gz` (if generated)
