Minimal Rank of Kähler Forms Bounds Tseitin Formula Proof Entropy

Entry ID: e51ec8114266 **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-29 12:01:57 UTC

1. Conjecture

Field A (mathematical branch): Complex Geometry (Kähler Manifolds) **Field B** (complexity object): Resolution proof complexity (Tseitin formulas)

Statement:

For a Tseitin formula with n variables and m clauses, the minimal rank of the Kähler form of its associated variety is upper-bounded by $O(m^{\{1/3\}n} \{2/3\})$.

Rationale (proposer's reasoning):

Kähler forms provide a geometric invariant that could potentially reveal underlying structure in the resolution proof complexity. A higher rank might indicate a more complex geometry, which could correlate with increased proof entropy.

Taxonomy category: c003b_cumulative_entropy (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): 940d9165e4cf17ae

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

The conjecture is supported if the minimal rank of the Kähler form is less than or equal to $O(m^{\{1/3\}n} \{2/3\})$ for at least 25 out of 30 random seeds, and the aggregate mean of the correlation between minimal rank and proof entropy is within $\pm 5\%$ of expected.

3. Barrier filter (F1)

Final: PASS

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
RELATIVIZATION	SAFE	1.00	SAFE	UNCERTAIN
NATURAL_PROOFS	SAFE	0.50	UNCERTAIN	UNCERTAIN

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
ALGEBRIZATION	SAFE	1.00	SAFE	SAFE
KARP_LIPTON	SAFE	1.00	UNCERTAIN	SAFE

4. Novelty audit

Verdict: NOVEL against 0 hits across arXiv + Semantic Scholar + ECCC

Search queries (3): - "Kähler forms" AND "Tseitin formula" AND complexity" - "minimal rank" IN (Kähler manifolds) AND resolution proof" - "entropy" related TO (Kähler geometry) AND Tseitin formulas

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)

Sandbox: isolated subprocess, stdlib-only, ≤90s wall time per cycle **Execution:** rc=0, elapsed=0.4s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
    Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
    proofStateEntropy(sigma) := sigma.activeClauses.card
    cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

8. Critic adversarial review

Critic verdict: CHALLENGE

Critic reasoning:

The test code focuses on computing the cumulative proof entropy for Tseitin formulas using Davis-Putnam variable elimination. However, it does not directly measure the minimal rank of the Kähler form of the associated variety, which is the actual claim of the conjecture. The metric used (phi_count_loglog_slope_vs_n) is related to the number of clauses and steps in the resolution process but does not correspond to the minimal rank.

9. Final verdict & safety rail

Verdict: INCONCLUSIVE

Reasoning:

The test code focuses on computing proof entropy rather than directly measuring the minimal rank of the Kähler form, which is the actual claim of the conjecture. The critic challenged the validity of the test and the pre-registered support condition was not unambiguously met. | next: Develop a new test that directly measures the minimal rank of the Kähler form for Tseitin formulas and evaluate it against the conjecture.

11. Audit log (LLM calls)

Total LLM calls: 7

#	Phase	Provider	Model	Tokens in	out	Latency (ms)

(full prompt+response transcripts available in `research/audit/e51ec8114266.jsonl`)

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/e51ec8114266.jsonl` for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: `research/pvsnp_sandbox/test_*.py` (per-cycle)

Replay tarball: `research/replay/e51ec8114266.tar.gz` (if generated)
