Minimal Local Cross Section Rank Bounds Resolution Proof Width for Random k-CNF under Non-Commutative Geometry

Entry ID: 75f0568b00e8 **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-30 07:14:26 UTC

1. Conjecture

Field A (mathematical branch): Non-Commutative Geometry **Field B** (complexity object): Resolution proof complexity

Statement:

For a random k-CNF formula with n variables, the minimal local cross section rank of its associated non-commutative algebraic variety is $O(n^2 / \log n)$, which bounds the resolution proof width from above.

Rationale (proposer's reasoning):

Non-commutative geometry has recently provided tools to study complex systems through geometric objects. By mapping k-CNF formulas to non-commutative algebras, we can potentially derive insights into their computational complexity using geometric properties like local cross section rank.

Taxonomy category: c003b_cumulative_entropy (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): 6460afaf4cd2ac58

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

The conjecture is supported if the correlation coefficient between the minimal local cross section rank and resolution proof width across 30 seeds is ≥ 0.8 , with no seed showing a rank higher than $3n^2 / \log n$.

3. Barrier filter (F1)

Final: PASS

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
RELATIVIZATION	UNCERTAIN	1.00	HITS	UNCERTAIN
NATURAL_PROOFS	SAFE	0.50	UNCERTAIN	UNCERTAIN
ALGEBRIZATION	UNCERTAIN	0.90	UNCERTAIN	HITS
KARP_LIPTON	SAFE	0.50	UNCERTAIN	UNCERTAIN

4. Novelty audit

Verdict: ADJACENT_OK against 5 hits across arXiv + Semantic Scholar + ECCC

Search queries (3): - "non-commutative geometry" AND "resolution proof complexity" AND k-CNF" - "minimal local cross section rank" AND non-commutative algebraic variety AND $O(n^2 / \log n)$ - "resolution proof width" bound "non-commutative geometry"

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)

Sandbox: isolated subprocess, stdlib-only, $\leq 90s$ wall time per cycle **Execution:** rc=0, elapsed=0.5s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
    Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
    proofStateEntropy(sigma) := sigma.activeClauses.card
    cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

8. Critic adversarial review

Critic verdict: CHALLENGE

Critic reasoning:

The test code focuses on the resolution proof entropy for Tseitin formulas, which is a different metric than the minimal local cross section rank of non-commutative algebraic varieties as described in the conjecture. There is no evidence provided that the resolution proof entropy directly corresponds to the minimal local cross section rank.

9. Final verdict & safety rail

Verdict: INCONCLUSIVE

Reasoning:

The test code focuses on resolution proof entropy for Tseitin formulas, which is different from the minimal local cross section rank of non-commutative algebraic varieties as described in the conjecture. The critic challenged the validity of using this metric to support the conjecture. | next: Further research is needed to establish a direct correspondence between resolution proof entropy and the minimal local cross section rank, or to clarify if the conjecture's metric should be adjusted to mat

11. Audit log (LLM calls)

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/75f0568b00e8.jsonl` for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: `research/pvsnp_sandbox/test_*.py` (per-cycle)

Replay tarball: `research/replay/75f0568b00e8.tar.gz` (if generated)
