Minimal Geometric Entropy of Projective Varieties Bounds Resolution Proof Width

Entry ID: a87e6a40a968 **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-30 06:16:35 UTC

1. Conjecture

Field A (mathematical branch): Algebraic Geometry (Projective Varieties) **Field B** (complexity object): Resolution proof complexity

Statement:

For a given Tseitin formula on d -regular graphs, the minimal geometric entropy of its associated projective variety is upper-bounded by the resolution proof width, i.e., $E[\min_geo_entropy(V)] \leq \Theta(res_width(\varphi))$ for all $\varphi \in \Phi_d$.

Rationale (proposer's reasoning):

Projective varieties encode combinatorial structures that can be used to represent Boolean functions. The geometric entropy of these varieties provides a measure of complexity, which may shed light on the proof complexity required for their resolution. This conjecture could potentially reveal a new connection between algebraic geometry and computational complexity.

Taxonomy category: c003b_cumulative_entropy (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): dfb042c1f76faaa5

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

The conjecture is supported if, across 30 random seeds, the minimal geometric entropy of the projective variety $E[\min_geo_entropy(V)]$ is less than or equal to the resolution proof width $res_width(\varphi)$ for all $\varphi \in \Phi_d$ with a mean difference between the two metrics ≤ 3 .

3. Barrier filter (F1)

Final: PASS

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
RELATIVIZATION	SAFE	1.00	SAFE	SAFE
NATURAL_PROOFS	SAFE	0.50	UNCERTAIN	UNCERTAIN
ALGEBRIZATION	SAFE	1.00	SAFE	SAFE
KARP_LIPTON	SAFE	1.00	SAFE	SAFE

4. Novelty audit

Verdict: ADJACENT_OK against 9 hits across arXiv + Semantic Scholar + ECCC

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)

Sandbox: isolated subprocess, stdlib-only, ≤90s wall time per cycle **Execution:** rc=0, elapsed=0.5s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
    Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
    proofStateEntropy(sigma) := sigma.activeClauses.card
    cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

8. Critic adversarial review

Critic verdict: CHALLENGE

Critic reasoning:

The test code focuses on the cumulative proof entropy (Phi) of Tseitin formulas, which is a different metric than the minimal geometric entropy of projective varieties. The conjecture states an upper bound for the minimal geometric entropy, but the test measures something else, potentially leading to incorrect conclusions.

9. Final verdict & safety rail

Verdict: INCONCLUSIVE

Reasoning:

The test code measures cumulative proof entropy (Phi) of Tseitin formulas, which is different from the minimal geometric entropy of projective varieties as stated in the conjecture. The critic has challenged the results, and the pre-registered support condition was not unambiguously met. | next: Further investigation is needed to clarify whether the test metrics are indeed related to the conjectured metric. If they are not directly related, we should focus on tests that measure minimal geometric

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/a87e6a40a968.jsonl` for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: `research/pvsnp_sandbox/test_*.py` (per-cycle)

Replay tarball: `research/replay/a87e6a40a968.tar.gz` (if generated)
