Minimal Local Cohomology Rank of Tseitin Formulas Bounds Cumulative Proof Entropy

Entry ID: c66f1dbb4c96 **Verdict:** INCONCLUSIVE **Recorded:** 2026-05-30 06:43:26 UTC

1. Conjecture

Field A (mathematical branch): Algebraic Topology (Local Cohomology) **Field B** (complexity object): Cumulative Space (Proof entropy)

Statement:

For every Tseitin formula F on n variables, the cumulative proof entropy $\Phi(F)$ is bounded below by $O(n^{\log(n/2)})$ when the minimal local cohomology rank of the term overlap graph of F is greater than 1.

Rationale (proposer's reasoning):

Local cohomology provides a rich algebraic invariant for studying the structure of spaces. If Tseitin formulas with higher local cohomology ranks require more entanglement in their resolution proof, this could explain the observed lower bound on cumulative proof entropy.

Taxonomy category: c003b_cumulative_entropy (status at proposal time:)

2. Pre-registration (Popper-style)

Hash (SHA-256 prefix): ed104261e844f175

This hash commits to the conjecture statement, acceptance criterion, and seed list **before** the empirical test runs. Tampering with the test or its data after this hash was computed would be detectable.

Acceptance criterion:

The conjecture is supported if at least 90% of n -variable Tseitin formulas have a term overlap graph with minimal local cohomology rank > 1 and cumulative proof entropy within $O(n^{\log(n/2)})$. The conjecture is falsified if any formula has a minimal local cohomology rank ≤ 1 with $\Phi(F)$ not within $O(n^{\log(n/2)})$ or less than 10% of formulas meet these conditions.

3. Barrier filter (F1)

Final: PASS

Barrier	Verdict	Confidence	LLM ₁	LLM ₂
RELATIVIZATION	SAFE	1.00	SAFE	SAFE
NATURAL_PROOFS	SAFE	1.00	SAFE	SAFE
ALGEBRIZATION	SAFE	1.00	SAFE	SAFE
KARP_LIPTON	SAFE	1.00	SAFE	SAFE

4. Novelty audit

Verdict: NOVEL against 0 hits across arXiv + Semantic Scholar + ECCC

Search queries (3): - "minimal local cohomology rank" AND Tseitin formulas AND proof entropy"
- "cumulative proof entropy" AND "Algebraic Topology" AND Tseitin formulas" - "term overlap graph" AND Tseitin formulas AND local cohomology rank

5. Empirical test harness

Multi-seed protocol: 5 seeds (11, 23, 37, 53, 71)

Sandbox: isolated subprocess, stdlib-only, ≤90s wall time per cycle **Execution:** rc=0, elapsed=0.5s

5.1 Generated Python source

```
#!/usr/bin/env python3
"""C-003b cumulative entropy – FAITHFUL reference harness.

Computes the REAL cumulative proof entropy
    Phi(pi) = sum_t |activeClauses(sigma_t)|
over an actual resolution refutation (Davis-Putnam variable elimination)
of Tseitin formulas, exactly per the Lean definitions in Conjecture003.lean:
    proofStateEntropy(sigma) := sigma.activeClauses.card
    cumulativeEntropy(states) := sum (map proofStateEntropy states)
plus the width-aware totalLiteralWeight version (sum of clause sizes).

This is NOT the CDCL clause-count proxy used by the old c003b_counterexample.py:
it tracks the active clause database at EVERY elimination step of a genuine
resolution derivation, so it is the actual Phi the formalization names.

Pure stdlib (no networkx/pysat), so it runs in the pipeline sandbox.
Protocol: run_trial(seed)->dict with TRIAL/RESULT lines.

Author: Ludovico Kubler (harness by the SEC engine, hand-verified).
NOTE: no `from __future__ import annotations` – the sandbox injects a prelude
above the file, which would break that statement's must-be-first rule.

8. Critic adversarial review

Critic verdict: CHALLENGE

Critic reasoning:

The test code provided does not include the implementation of the term overlap graph or its local cohomology rank, which are crucial for the conjecture's statement. The test focuses on cumulative proof entropy but lacks the necessary components to assess the minimal local cohomology rank of the term overlap graph.

9. Final verdict & safety rail

Verdict: INCONCLUSIVE

Reasoning:

The test code does not include the implementation of the term overlap graph or its local cohomology rank, which are crucial for the conjecture's statement. The test focuses on cumulative proof entropy but lacks the necessary components to assess the minimal local cohomology rank of the term overlap graph. | next: Implement the missing components in the test code to include the term overlap graph and its local cohomology rank, then retest the conjecture.

11. Audit log (LLM calls)

(full prompt+response transcripts available in [research/audit/c66f1dbb4c96.jsonl](#))

12. Reproducibility

To reproduce this cycle:

1. Apply the test harness in section 5.1 with seeds 11,23,37,53,71
2. The Python sandbox is pure-stdlib; any Python 3.11+ should suffice
3. The full LLM transcripts are in `research/audit/c66f1dbb4c96.jsonl` for verification of provenance
4. The pre-registration hash in section 2 commits to the test design before execution; tampering would be detectable.

Sandbox file: `research/pvsnp_sandbox/test_*.py` (per-cycle)

Replay tarball: `research/replay/c66f1dbb4c96.tar.gz` (if generated)
